

SWE-bench Multimodal evaluation status

Per-prediction results for both with_image and without_image. The patch column records whether the model diff applied. The reason column separates harness completion, model-test failures, runner failures, and missing reference baselines.

Prediction rows	Unique instances	Complete pairs	Harness completed	Resolve scored	Resolved yes
314	157	157	293	205	71

How to read the table

Tests / passed / failed describe the model-patch suite run. **Patch** reports real git-apply status in the checked-out repository; "not checked" means execution stopped before that stage. **F2P, P2P and Resolved** require both before_patch and gold reference results. A dash means scoring is still undefined. **Resolved = no** means scoring was possible and the patch did not satisfy every required test.

With-image / without-image pair audit

The selected folder contains 314 prediction rows for 157 unique instances: 157 instances have both variants and 0 have only one selected variant. Missing means no counterpart prediction row exists in this paired selection; it is not a test failure. Four unmatched source files were excluded: PrismJS__prism-1585, carbon-design-system__carbon-12410, eslint__eslint-14242, prettier__prettier-8536.
